Comment:

Bone Resorption Assay - Urine

Methodology: Competitive Immunoassay

Results

Reference Limits

Nanomoles deoxypyridinoline (DPD)
per millimole creatinine

Bone Collagen Peptide (DPD) 4.1

<= 5.4

Interpretive Detail:

DPD value above the Reference Limit indicates that resorption of bone is occurring faster than normal.

DPD value equal to or below the Reference Limit is considered a normal result. In general, the lower the result the better to avoid development and/or progression of osteoporosis.

These test results are not for the diagnosis of disease. They are intended to provide nutritional guidelines to qualified healthcare professionals with full knowledge of patient history and concerns to assist in their design of an appropriate healthcare program.
